---

Clinician [well-being](#) has important implications for patient safety and quality of healthcare delivery. In this study, researchers used a concept analysis to identify attributes of nurse well-being at the individual level (e.g., satisfaction, compassion) and [organizational/community level](#) (e.g., [teamwork](#), pride in work). These findings can support the development of a standardized definition of nurse well-being to guide future research and policy considerations around well-being and [burnout](#).
