[Patients](#) and clinicians may hold [implicit](#) gender biases and rate women clinicians more negatively. In this study, adverse event reports written about residents were reviewed to determine if resident gender was associated with different types and frequency of incident reports. The most common complaint about men physicians involved a medical error, while the most common complaint type about women included a [communication](#)-related event. Additionally, women were more frequently identified by name only, without a title such as “doctor”.
