Patients and families are [encouraged](#) to play an active role in patient safety by, for example, reporting [inaccurate](#) or [incomplete](#) electronic health record notes after visits. In this study, patients and families at two US healthcare sites (pediatric subspecialty and adult primary care) were invited to complete a survey (OurDX) before their visit to identify their visit priority, recent medical history/symptoms, and potential diagnostic concerns. In total, 7.5% of patients and families reported a potential diagnostic concern, mainly not feeling heard by their provider.
