[Patient and caregiver engagement](#) is an important [strategy](#) for improving the quality and [safety](#) of care. This qualitative study with 18 patients and/or caregivers explored perspectives on engagement in primary care. While participants were supportive of engagement in their care and safety, some expressed concerns regarding additional workload for patients. Participants also provided feedback on a patient safety guide for primary care (PSG-PC) and identified areas to embed the PSG-PC into routine interactions with primary care, particularly for individuals caring for a family member with complex or chronic health conditions.
