[Clinical decision-making](#) can be influenced by both individual and [team factors](#). This article describes the de Groot Critically Reflective Diagnoses Protocol (DCRDP), which can be used to evaluate how group dynamics and interactions can influence collective clinical decision-making. Transcripts of recorded decision-making meetings can be coded based on six DCRPD criteria (challenging groupthink, critical opinion-sharing, research utilization, openness to mistakes, asking and giving feedback, and experimentation), which identify teams that are interactive, reflective, higher functioning, and more equitable.
