Physical and nonphysical violence can negatively impact the [work environment](#), increase rates of burnout, and lower perceptions of patient safety. This study details workplace violence experienced and witnessed by perioperative anesthesiologist assistants, certified registered nurse anesthetists, [physicians](#), and registered nurses. More than three-quarters of participants reported having experienced or witnessed some form of workplace violence. Less than half reported satisfaction with how the organization [addressed](#) and resolved the situation. The most common sources of workplace violence were the patient or a family member, friend, or physician in the perioperative environment.
